

Coalición de Ex trabajadoras (es) y Trabajadoras (es) de la Industria Electrónica Nacional, **CETIEN**

Report: Occupational Health CETIEN 2019

Objective. Electronics industry workers in Jalisco trained in occupational health and toxic management.

The training we took was achieved after changing some dates in August on two dates, on August 11 and 18. We have started with a work plan on occupational health that we had been neglecting because of our little experience, but thanks to your support we now start with a couple of workshops and with the willingness to continue with this type of training because there is a long way to go and much support to provide to our partners.

We want to change this normality with which the diseases of the workers are managed from being diseases typified as general to be really diagnosed as they are.

We begin to create spaces for reflection so that they think about the diseases they suffer and if these are possibly derived from work, the toxic substances they handle, the positions or mechanical movements performed in their operation.

According to the follow-ups of some of the cases of occupational disease that have been monitored since Cetien, each worker does not relate their discomforts to their work even though they spend a third of their day or more on it.

Within the health of the workers, we have realized that, in general, although the same worker knows that it is a disease caused by his work, in the IMSS (Mexican Social Security Institute) it is not typified of this. They usually look for a diagnosis that is related to home or street issues.

If the worker mentions that it is at work they are stuck, and on the occasions that there is evidence for the disease to be classified as part of the job they tell the worker to quit if the work hurts him.

With this training we hope that each beneficiary can demand adequate protection in their workplace, seek and demand information about the risks to their health, that they worry about their health and take more account of the risks to their health so that they can prevent and Protect, demand in case of any damage to your health the appropriate treatment and attention so that you can recover your health as much as possible in your workplace or where you receive public medical care, or in the worst case when not There is repair of any damage to your health, be compensated fairly.

The measurement of the results is quite slow and one could say that they are not very visible and immediate, as we mentioned this work in training is important and there is no support in this field for the workers of this sector in Jalisco, for now we will continue with the training.

We will continue working in occupational health workshops, we will continue to train ourselves and, above all, we will begin to document cases of the companions around their occupational health, in the future to make a real report of what happens with the workers of the electronic industry here in Jalisco.
